

ABSTRACT OF THE DISCLOSURE

5 A method of evaluating for the presence of a polypeptide in an analyte, using
an addressable array of capture agents linked to a substrate. The analyte is exposed to
the array and a set of fixed capture agents, such that the target molecules will bind to
the array by means of the capture agents. After the target molecule has bound to the
capture agents, it is modified using a label. The label does not interact or mark the
10 capture agent. Kits using such arrays are further provided.
